I think the focus on speed (speed, speed, speed), gives an impression that Lightroom is for someone who has to make a 100 images shoot the same thing very quickly. For such a person a host of functions such as Multi-touch speed improvements and overall UI speed is what matters. But for me, an amateur photographer who shoot most of my photo-world in a tripod, I think the new adjustable frame, effects and adjustment tools would me more use to shoot portraits. The speed advantages of the new product will be most relevant for people working with a DSLR. But you can never have it all. I'm a Lightroom power user, for years (10+). LR4 was my personal workhorse (I shoot 35mm and medium format). In many ways it's a superior program to Photoshop. Photoshop is mostly used because it's the herd when people use software or hardware. For most projects, people need to edit and mix photos. If you're a "hipster," you don't need Lightroom, you probably use Photoshop. The same applies to the crapware that people use (dropbox? etc).

Seeing as it's the case for nearly all the entries, the new ICM is a real, honest-to-goodness issue for most folks besides the "Harvey's". In other words, do the "eternal battle" of whether or not you need to pay for an "upgrade" for your software. If you don't have the need, you don't need to upgrade. Simple.

Here are my tips if you decide to stay with LR:
-create multiple catalogs. Number them. Lots of folks fight over the "number one" cat. What's really important is the size of your collection.
- have nothing in your catalogue but the photos you need to edit. This will save loads of space. Remove notes, images that no longer apply (i.e., modified file attributes or Image Services are no longer available).
- use smart previews in the catalogue. What I really mean by this is make sure you have selected a DNG of the image. Lightroom will automatically use the preview JPEG, which is NOT what you want. Enter "Smart Preview" as the photo's "DNG" name and make it your keyed-in preview.
- utilize Actions. Add (and delete) actions as needed (if you don't have any, that's fine). Remember that actions happen on every photo. Not only will it save you time but by speeding up the workflow, you save your "edits" from getting lost if the photos are stored on a server/drive with slow speed. Not to mention saving the DNGs.

In other words, if you don't need to touch a photo unless there is a special reason like viewing with a specific monitor, create a separate catalog...or better yet, several.

If you HAVE to use Photoshop, don't worry about the "upgrades." Just do the work and move on to LR. Admittedly, there would be a learning curve. I can't teach you Photoshop. It's just a different way (although, man, the interface/workflow is no different). All you can do is use the search features in LR and save an image to Photoshop. You can even tell LR to launch itself if an image is modified.

Even though I know a few graphic designers and illustrators, don't worry about choosing Photoshop, it's the norm. If you're a "photographer," just stay with the brand. You have the same leverage if someone wants to use Lightroom (which I can attest to, because I have attempted some work in it). In terms of workflow, it costs the same.

This new version has some pretty cool additions. I really like the linear timeline drag [....]

I can only see myself going from LR to PS if there is a need to edit from PS. My suspicion is that the new workflow is going to be adopted by PS first (because of the photo editing). It's unlikely I'll ever go back to LR.

Good Luck!

Automatic Fixes
The first of Photoshop's major new features, automatic fixes, works with layers to make sure that images are ready for print or web. Layers are the basic units of editing in Photoshop, as well as many other applications. Autofixes use a large network of machine learning algorithms to identify defects automatically. While it's not possible to stop a single pixel from changing, an entire image can be swapped out with a single command. Thanks to the large number of layers in an image, Autofixes can run with a large number of layers at once. This creates a significant increase in processing speed. **Painting and Cropping**
If you have a subject that's similar in appearance to another photo or painting in your library, a simple painting example demonstrates how Photoshop integrates layers to create a natural-looking sky. Using a selection tool, you can select a portion of the sky, then use a new paintbrush tool to apply a color or blur that color, or even add a cloud. You can use the same process to bevel a building, like the façade of the Parisian apartment featured here, or even to remove a cloud entirely.
Professional-Grade Content Navigator
Arguably one of the most powerful features of Photoshop for the year is the new Content Navigator. Instantly open the navigator on any image and easily navigate to any properly named and structured layer, or group. Navigating from one image to another is also a breeze, with a simple command (pictured above). This is done using the Replace Selection tool (top right). Click the dialog box, and find the new Content Navigator tool. This is a feature that will revolutionize content creation in all other Adobe Creative Suite products.

New Photoshop has a new workspace called \"Blackmagic Design DaVinci Resolve\" within the software. Now you can perform the retiming within the software itself. A retiming tool was added to the software. The tool lets you apply a new look to footage and retime it on the fly without re-rendering the original footage. It also lets you add a new look to footage, such as a new color space, and rescan the footage. You can choose a new color space for retiming and then use the Blackmagic Resonate tool for creating a cinematic look. Selective Color Adjustment (beta) in Photoshop adds a layer of quality and control beyond what's possible with the automatic color correction often touted by other editing applications. The selective color edition gives you a better idea of how your editing will look on a variety of different surfaces, and you can easily blend the quality of the color across the whole image by carefully tweaking its settings. To access it, go to Edit > Color > Selective Color Adjustment and you'll see options for a variety of different surfaces, including paper, canvas, wood, fabric, metal, glass and plastic. As we know, the web is changing, and ensuring that your web, mobile, and in-app experiences are optimized is a challenge for web designers. Some, like you, are already using a design tool like Photoshop to create the layouts, logos, and icons for all of your sites,

apps, and designs. And with the design of websites and apps becoming more complex, you're looking for design tools that can help you in creating and editing simple and complex designs more easily and affordably.

Other new updates include:

- A collection of new brushes for retouching;
- A redo button to get rid of features so you can start again with a clean slate;
- A false color treatment for black & white that will give a red, green or blue tint to your photos;
- A simpler way to find more editing tools;
- Refine Edge, a powerful tool that toggles between brush and selection based editing with the swipe of a finger;
- A chemical peel effect that adds a frosty glow to your skin.

The software is also the first version to come with dual-pane view in the Layers panel, allowing you to move around and preview the layer controls on a separate panel from the rest of the image. The version also introduces a brand new version of the Liquify filter, which can now be used to alter (in a rather psychedelic manner) individual objects or groups of elements. A new Content Aware Fill feature is also available in the latest version of the software. This will not only fill up empty areas in images, but will also recognize similar colors in elements like masks, the "Select" tool, or even text. Panasonic's LUMIX cameras, which are normally introduced at the CES trade-show in Las Vegas, have turned up online. While the CES show will be about image and video tech this year, it is worth noting that, all together, 22 new cameras and accessories have appeared for the LUMIX line. Some of the new additions for the new Panasonic Camera LUMIX GH7 include the new:

Adobe's Web Launching technology lets you open web pages or other apps in Photoshop directly. The Site Launch feature opens and displays a web page in Photoshop and lets you easily add content, format, and addresses as content or a selection. Another useful feature being introduced as of Photoshop CC is the 3D Camera Console. The 3D Camera Console is a new live preview window where you can get immediate feedback while you are preparing a shot. The interface has a display of the 3D space, overlaid with features such as 3D Layers with their correct Transforms, Camera and Lens settings. **Photoshop Masking**: Thanks to the development of the Photo Merge, you can now create masks on your layers and have Photoshop add the mask to the background of the layer – even

when using the Layer Masks feature. So now, when you have a quick idea of how a layer looks, you can just quickly open a Layer Mask to prevent the current layer from showing. Because masks essentially disappear, you no longer have to use the Layer Blending tool to balance your image. You can also use the Layer Blending options to add or subtract the mask layer. The new Free Transform tool features a new Grid option that lets you accurately align objects in your image with respect to a grid. This option is available within the toolbar and it is available in both Layer and Stroke versions of the Free Transform tool. Moreover, you can access this Grid option from the Free Transform Panel; this panel is useful for quickly and accurately moving an object around. This tool also now has a new "Lock" feature. When you select any tool in the Tool Options panel, it's now possible to lock the tool and prevent accidental changes.
